

Stelligent Mini-Project

Write code in a programming language (or languages, configuration management platforms, etc.) of your choice that provisions an environment in AWS. The infrastructure code only needs to provision the environment resources and configure a web server. The home page should display a static HTML page with the words: “Automation for the People”¹.

Requirements:

- AWS must be the target infrastructure.²
- Single Command/One-Click launch of environment.
 - Some prerequisites are OK as long as it is properly documented.
- Commit all code to the private repository that is provided for you in Github.
- Include a README.MD containing detailed directions on how to run, what is running, and how to cleanup.
- Include some form of automated tests. Demonstrate a test-first mentality.

¹ Just a static HTML page; it doesn't need to be a complete web application.

² Upon completion, you will receive a \$20 Amazon gift card to offset your AWS costs (unfortunately, you cannot currently use Amazon gift cards to directly pay for your AWS fees).
